Application/Control Number: 10/630,731

Art Unit: 3632

This is the non-final Office Action for the serial number 10/630,731, DISPLAY SUBSTRATE ACCOMMODATING TRAY AND APPARATUS AND METHOD FOR REMOVING THE DISPLAY SUBSTRATE, filed on 7/31/03.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent # 4,972,951 to Vartanian.

Vartanian teaches a tray comprising a bottom section (20) supports a display substrate (video tape, column 2, lines 23-27) on at least a portion of a planar top surface (18) of the bottom section in a vicinity of the center of the display substrate, wherein the display substrate contacts at least a portion of the bottom section in the vicinity of the center of the display substrate. The tray includes a frame (16) provided along a periphery of the bottom section and the frame projects to a level higher than a level of the top surface of the bottom section. The tray includes a flange-like engaging section (42) protruding externally from walls of the frame in a substantially horizontal fashion. The frame has a planar top surface and the flange having a wall (between the flange and frame) defining an inner periphery thereof to define a positional relationship (see figure 2). The planar top surface of the frame is parallel to the planar top surface of the bottom section having the display substrate and the wall of the flange-like is

Art Unit: 3632

connected to the planar surface of the frame. The wall of the flange-like projects a level higher than the level of the planar top surface of the frame with respect to the surface of the bottom section.

Vartanian teaches the width of the frame but fails to teach the width of the frame is substantially larger than the distance between the top of the top surface of the frame and the top surface of the bottom section. It would have been obvious for one of ordinary skill in the art at the time the invention was made to have modified the width of the frame to be larger than the distance between the top of the top surface of the frame and the top surface of the bottom section to provide a larger surface area for supporting a smaller size of video tape (column 2, lines 26-27).

Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Vartanian in view of Japan Patent #2003-236953 to Nakajima et al.

Vartanian teaches the bottom section and frame are integrally formed but fails to teach the bottom section and frame are formed from a synthetic resin foam material. Nakajima et al. teaches the synthetic resin foam material (10). It would have been obvious for one of ordinary skill in the art at the time the invention was made to have modified Vartanian's bottom section and frame with synthetic resin foam material as taught by Nakajima et al. to provide insulating layer in the tray (see abstract in Nakajima et al. invention).

Art Unit: 3632

Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Vartanian and in view of US Patent # 6,116,427 to Wu et al.

Vartanian teaches a tray comprising a bottom section (20) supports a display substrate (video tape, column 2, lines 23-27) on at least a portion of a planar top surface (18) of the bottom section in a vicinity of the center of the display substrate, wherein the display substrate contacts at least a portion of the bottom section in the vicinity of the center of the display substrate. The tray includes a frame (16) provided along a periphery of the bottom section and the frame projects to a level higher than a level of the top surface of the bottom section. The tray includes a flange-like engaging section (42) protruding externally from walls of the frame in a substantially horizontal fashion. The frame has a planar top surface and the flange having a wall (between the flange and frame) defining an inner periphery thereof to define a positional relationship (see figure 2). The planar top surface of the frame is parallel to the planar top surface of the bottom section having the display substrate and the wall of the flange-like is connected to the planar surface of the frame. The wall of the flange-like projects a level higher than the level of the planar top surface of the frame with respect to the surface of the bottom section.

Vartanian teaches the width of the frame but fails to teach the width of the frame is substantially larger than the distance between the top of the top surface of the frame and the top surface of the bottom section. It would have been obvious for one of ordinary skill in the art at the time the invention was made to have modified the width of the frame to be larger than the distance between the top of the top surface of the frame and the top surface of the bottom section

Application/Control Number: 10/630,731

Art Unit: 3632

to provide a larger surface area for supporting a smaller size of video tape (column 2, lines 26-

Page 5

27).

Vartanian teaches the bottom surface but fails to teach the bottom surface having

plurality of openings. Wu et al. teaches plurality of openings (321) in the bottom surface. It

would have been obvious for one of ordinary skill in the art at the time the invention was made

to have added plurality of openings in Vartanian bottom surface as taught by Wu et al. to provide

viewing of the identification mark on top side of device without removing the upper/stacked tray

from the lower tray (column 3, lines 40-43 in Wu et al.'s invention).

Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Vartanian in view

of Wu et al. and in further view of Nakajima et al.

Vartanian teaches the bottom section and frame are integrally formed but fails to teach

the bottom section and frame are formed from a synthetic resin foam material. Nakajima et al.

teaches the synthetic resin foam material (10). It would have been obvious for one of ordinary

skill in the art at the time the invention was made to have modified Vartanian's bottom section

and frame with synthetic resin foam material as taught by Nakajima et al. to provide insulating

layer in the tray (see abstract in Nakajima et al. invention).

Allowable Subject Matter

Claims 6-8, 13 and 16-18 are allowed.

Response to Arguments

Application/Control Number: 10/630,731

Art Unit: 3632

Applicant's arguments filed 3/17/10 have been fully considered but they are not persuasive.

The applicant argues Vartanian's bottom with elongated recess would not have the capable of providing adequate support for the glass substrate. The examiner disagrees with the applicant because the glass substrate can come in variety shape such as one end of substrate having projection and the recess can accommodate the projection part of substrate when the glass is resting on the bottom surface. A spacer such as syrofoam can be inserted in the recess to support the glass substrate when it is mounted on the bottom surface. Vartanian's bottom surface with recess has the ability of supporting the glass substrate.

The applicant argues the ledge 42 in Vartanian's invention is not designed to provide a carrying section. The examiner disagrees with the applicant because the ledge having recess opening in the bottom area which provide sufficient space for a human's hand to be inserted therein to carry the tray. Therefore the bottom area of ledge 42 can be used as carry section.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Alfred Joseph Wujciak III whose telephone number is (571) 272-6827. The examiner can normally be reached on 8am-4:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, J. Allen Shriver can be reached on 571-272-6698. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
